

2. Draw a line from the dot to the 90° North point.
3. Rotate the line to the latitude of the destination.
4. Record the distance (CRS) and distance under the dot.
5. Draw a meridian from the dot to the 90° North point.
6. Rotate the disk to the line drawn in Step 3. The values of the meridians and parallels crossed by the line are the values of the meridians and parallels crossed by the line.
